**Abstract:** *The role of information technologies and digital tools in the development of management activities is expanding. The skills of creating electronic resources and using them in various situations are being developed. The introduction of digital management systems and the analysis of the effectiveness of innovative approaches, including the use of digital technologies, can automate the educational process and optimize the work of teachers.*

**Keywords:** *digital, technology, education, information, automatic, electronic.*

Digital technologies have entered our lives so rapidly that today it is impossible to imagine not only our daily activities, but also the development of socio-economic spheres without them. Naturally, digital technologies, like in other areas, are taking their place in primary education and preschool education.

The integration of digital technologies in the classroom is complex and multifaceted, including digital technologies increasing the skills of teachers and students, supporting families and innovations within educational programs. The effectiveness of language learning is increasing through digital educational resources, namely electronic textbooks, multimedia applications, interactive games and audio and video materials. There is an opportunity for instant communication between teachers and students and the ability to store lesson materials online and share them with students online. The student has the opportunity to receive independent education, namely, various language courses, IT and business courses are being opened. This is very useful for students, as they can study online without having to go out.

The Decree of the President of the Republic of Uzbekistan “On Approval of the Concept of Development of the School Education System of the Republic of Uzbekistan until 2030” No. PF-5847 dated 08.10.2019 states that innovative technologies in the field of education are constantly developing and their types are expanding.

In particular, teachers are involved in advanced training courses to teach digital technologies, and various types of electronic devices are being increased in each school and classroom. Nowadays, such technical equipment not only increases the interest of students, but also increases their interest in lessons. It is becoming easier for teachers to work with parents of students in the classroom.

Digital technologies are also gaining momentum in higher education institutions, that is, online education and distance learning systems have been developed since 2025.

Conducting classes over the Internet, organizing virtual classes have begun. International platforms such as Zoom, Coursera, Udemy, EdX are widely used. Platforms such as Moodle, Hemis Ziyonet, EduMarket have begun their activities in local systems.

Training teachers to integrate digital technologies, therefore, it is still necessary to revise current approaches and practices focused on interactive whiteboard education, technical and computer projectors, in practical terms. In addition to the formation of digital skills and competencies in teachers, such skills should be related to the content of each subject taught. Of these three dimensions, the one most emphasized by researchers is the pedagogical aspect, which involves thinking about new teaching strategies, discovering appropriate didactic methods to develop learning experiences using digital technologies, and making the right use of digital technologies. It is necessary in designing technological didactic material for teaching and student assessment.

**Conclusion:**

Information technologies and digital tools play a significant role in improving the efficiency of management activities in the current era. They are an important tool for automating processes, making data-based decisions, rationally using resources, and strengthening cooperation between employees and customers.

Through their effective use, information technologies not only modernize management systems, but also become an important factor in economic and social development.

In general, the rational use of information technologies and digital tools is of incomparable strategic importance in improving the quality of management activities, increasing efficiency, and achieving sustainable development.
